

ABSTRACT

A projector (1) includes a template memory (5), the template memory storing beforehand, for example data of template images made of only ruled lines. A displaying unit (6) of the projector (1) projects template images to a screen (S).
5 A digital camera unit (8) carries out imaging of characters, etc., that are written on the screen (S), together with projected template images. A CPU (2) sends data of the image that is carried out imaging, to a PC (100). The PC (100) receives the image data, and stores it to a storing unit (103).
